TROUBLESHOOTING AND ENGINEERING OF ANTIBODY CONSTRUCTS - PART I

Annemarie Honegger, PhD

Department of Biochemistry

University of Zürich

- Antibody fragments as building blocks for multivalent and multi-specific targeting constructs
- Source of antibody fragments: human antibodies and humanization of non-human antibodies
- Sequence variability and biophysical properties of human antibody variable domains
- Sequence and structural features that lead to unstable and aggregation-prone antibody domains
- Influence of domain interactions on the stability of antibody constructs
- Generalizable approaches to “repairing” poorly behaved antibody domains
- Discussion

Full-length IgG

Protein strategies for modifying interactions

Mutate V domain sequences using display libraries and/or rationale design

Potential impact of modifying interaction

Altered binding affinity or specificity

Mutate Fc sequence using display libraries and/or rationale design; select IgG isotype

↑ or ↓ ADCC
↑ or ↓ ADCP
↑ or ↓ CDC

Mutate Fc sequence using display libraries and/or rationale design

↑ or ↓ half-life

Antibody fragment lacking Fc

↓ Half-life, ↓ CDC,
↓ ADCC and ↓ ADCP

Glycosylation strategies for modifying FcγR and complement interactions

Aglycosylation

↓ ADCC, ↓ ADCP and ↓ CDC

Bisecting N-acetylglucosamine

↑ ADCC

Non-fucosylation

↑ ADCC

scFv as building blocks for multivalent constructs

Biophysical Properties

Leads

Different V_H families differ widely in biophysical properties

V_H2, V_H4, V_H6:
poor stability,
aggregation-prone

Why not just use the best framework?

Sequence features characteristic of particular germline families govern both stability and antigen binding characteristics

Hapten Binders

(52 structures)

Long CDR L1 and H2 loops
open CDR-H3 conformation

Oligomer Binders

(30 structures)

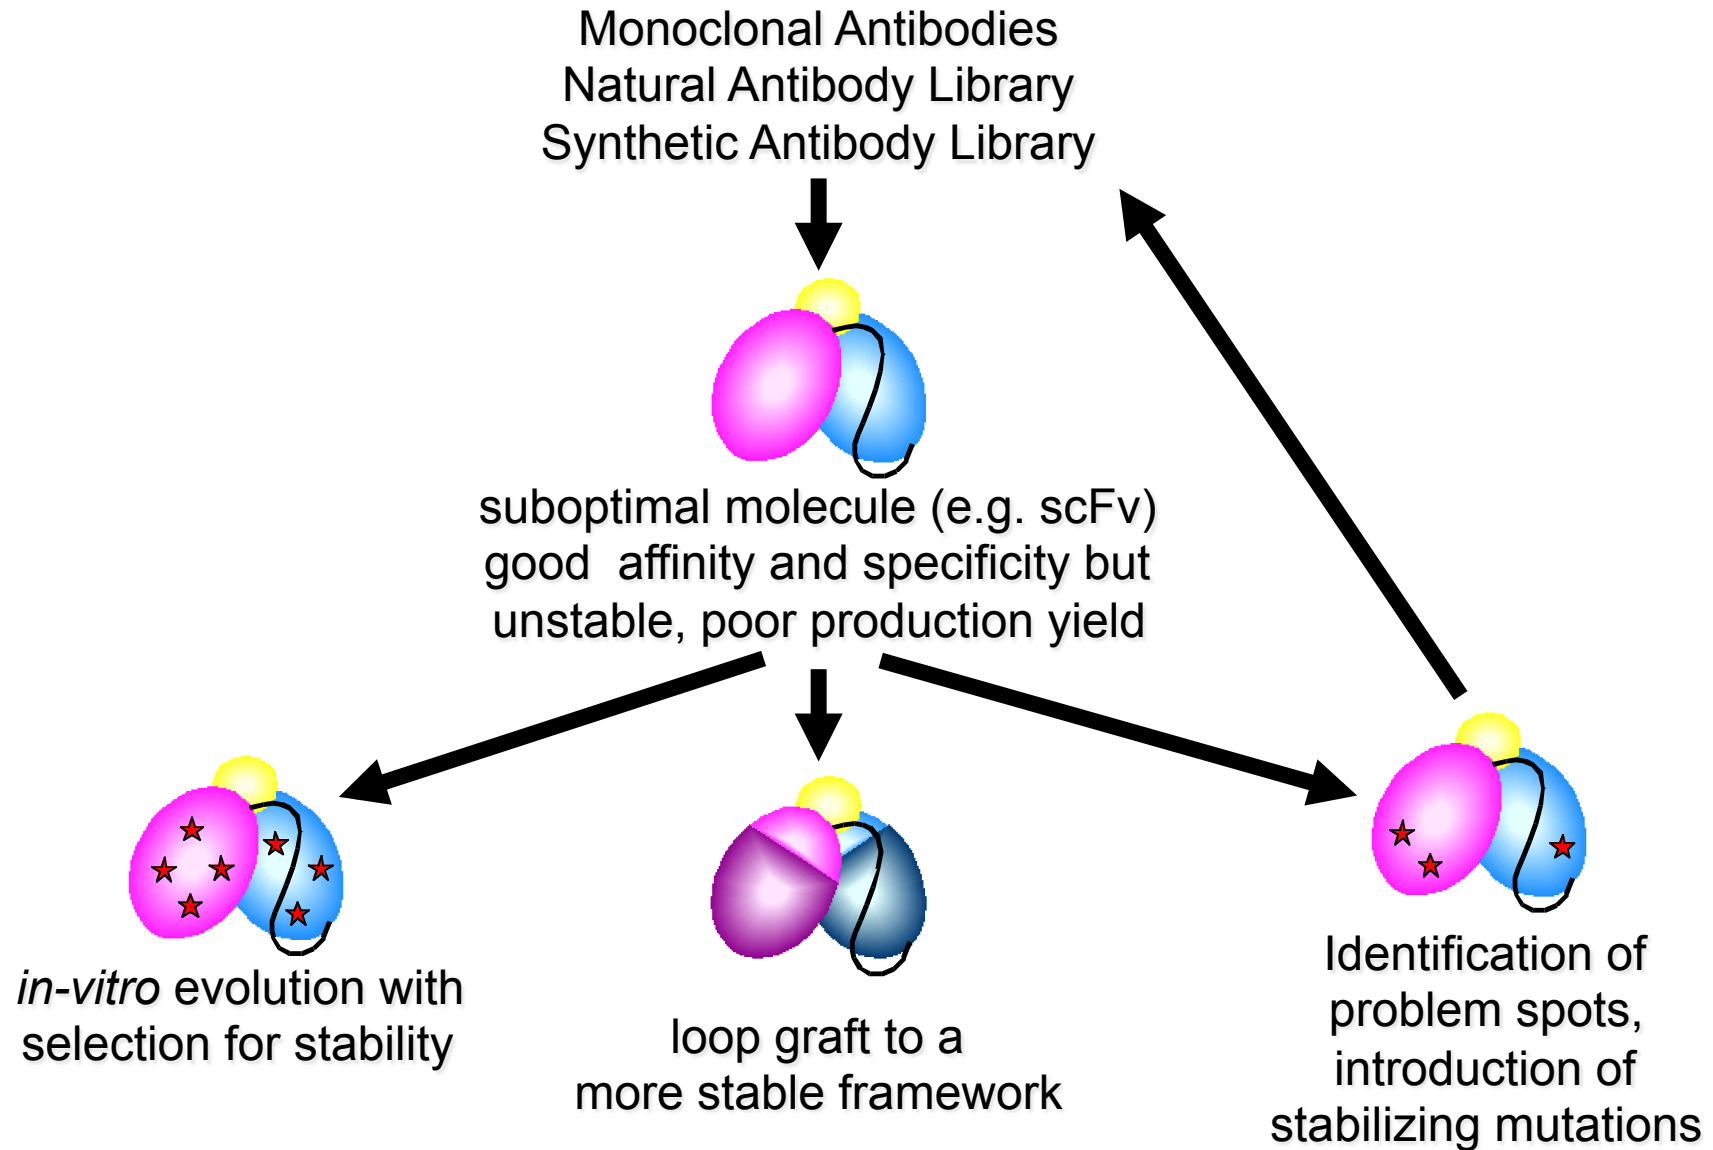

Protein Binders

(45 structures)

Short CDR L1 and H2 loops
closed CDR-H3 conformation

Strategies of Stabilization

Sources of antibody fragments

Non-human antibodies

need reengineering both for humanization and stabilization

Human repertoire libraries

no need for humanization, but may need stability engineering

Synthetic human antibody libraries

could be built based on stability-enhanced domain frameworks

- Iteratively replace subsequences of the murine antibody variable domain by closest subsequence from the human repertoire, checking for T-cell epitopes
- Graft CDR regions to closest human framework
- Graft CDR regions to most stable framework

Going for the human sequence closest to the original one is least likely to cause problems with affinity loss, but may result in stability problems

Domain Anatomy

CDR-Graft

The most closely related human and murine antibody sequence are more similar than the sequences of two antibodies belonging to different germline sequences

However, grafts between the most distant Frameworks are possible

It may be necessary to retain destabilizing features from the original antibody in order to preserve binding

Mismatch in CDR-Grafts

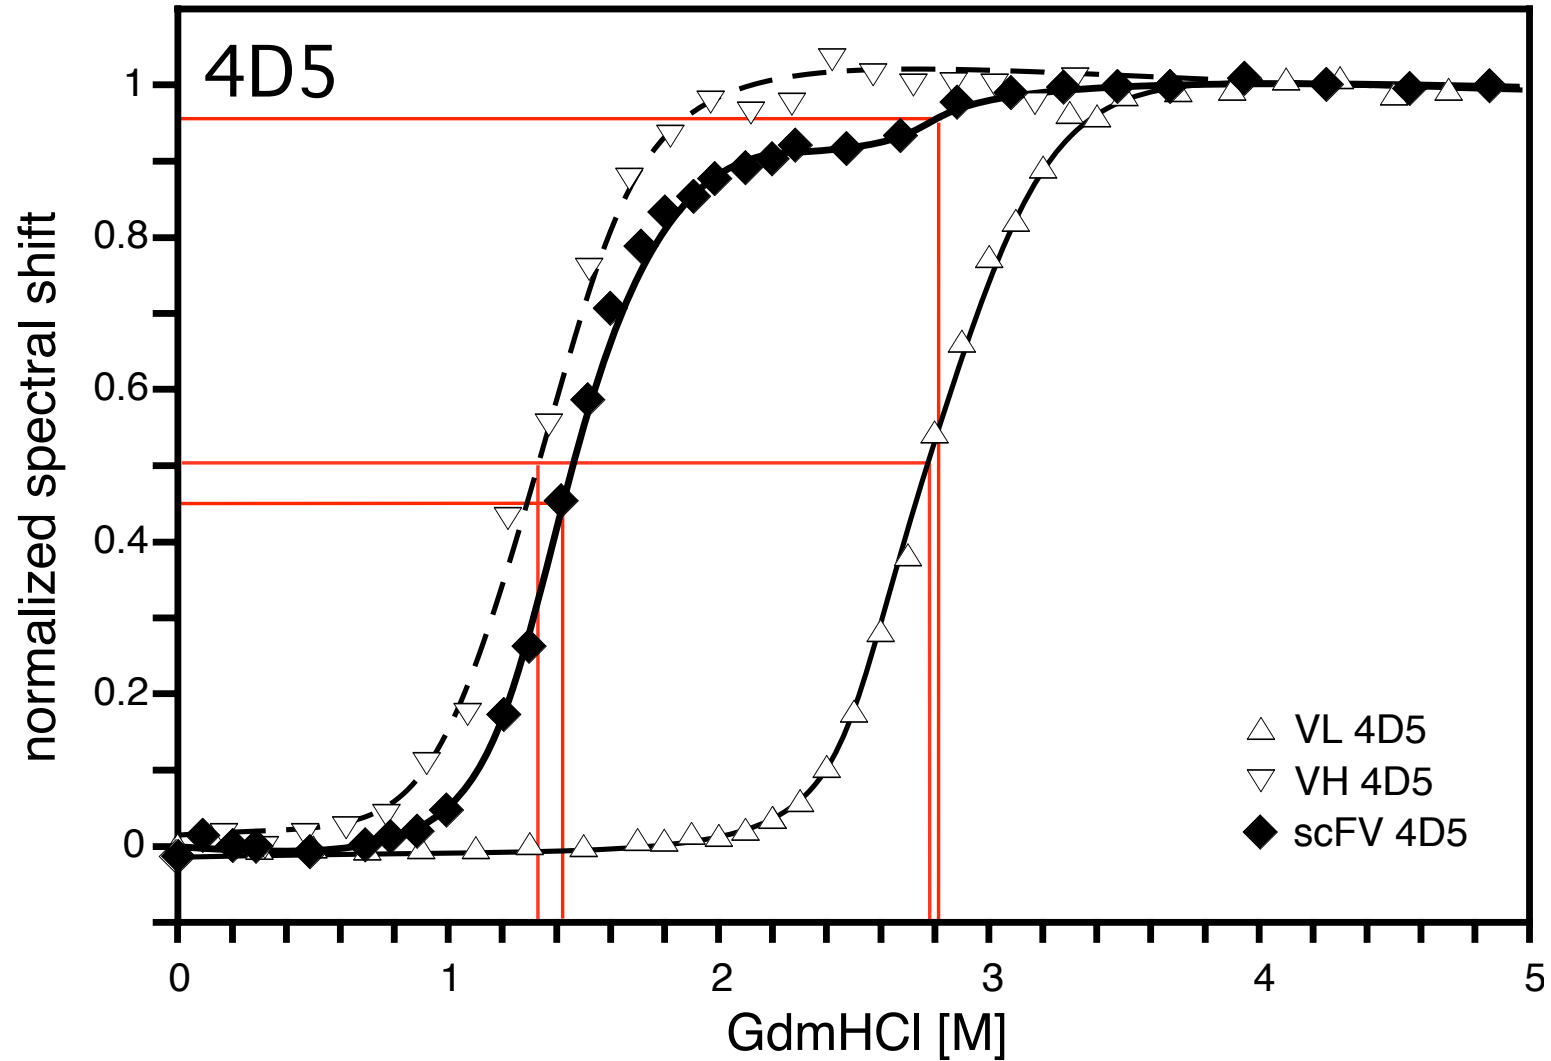

Although the huVH3 consensus domain is the most stable, grafts from VH1-like domains are less stable than expected

VH

Different V_H families differ widely in biophysical properties

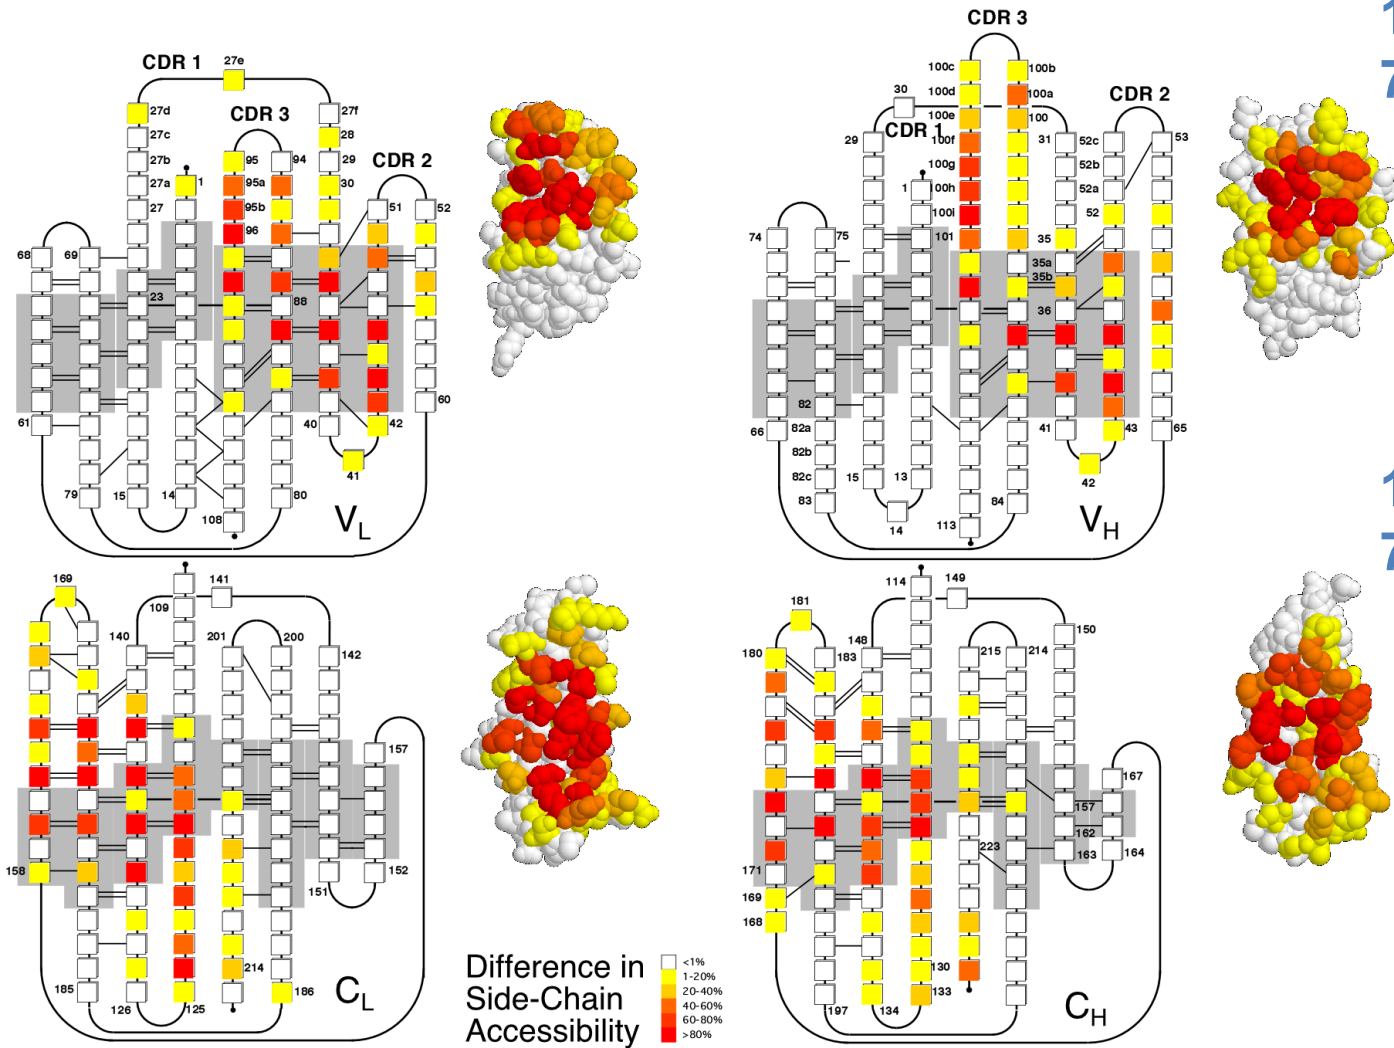

Stability of human consensus domains

Role of interface stability

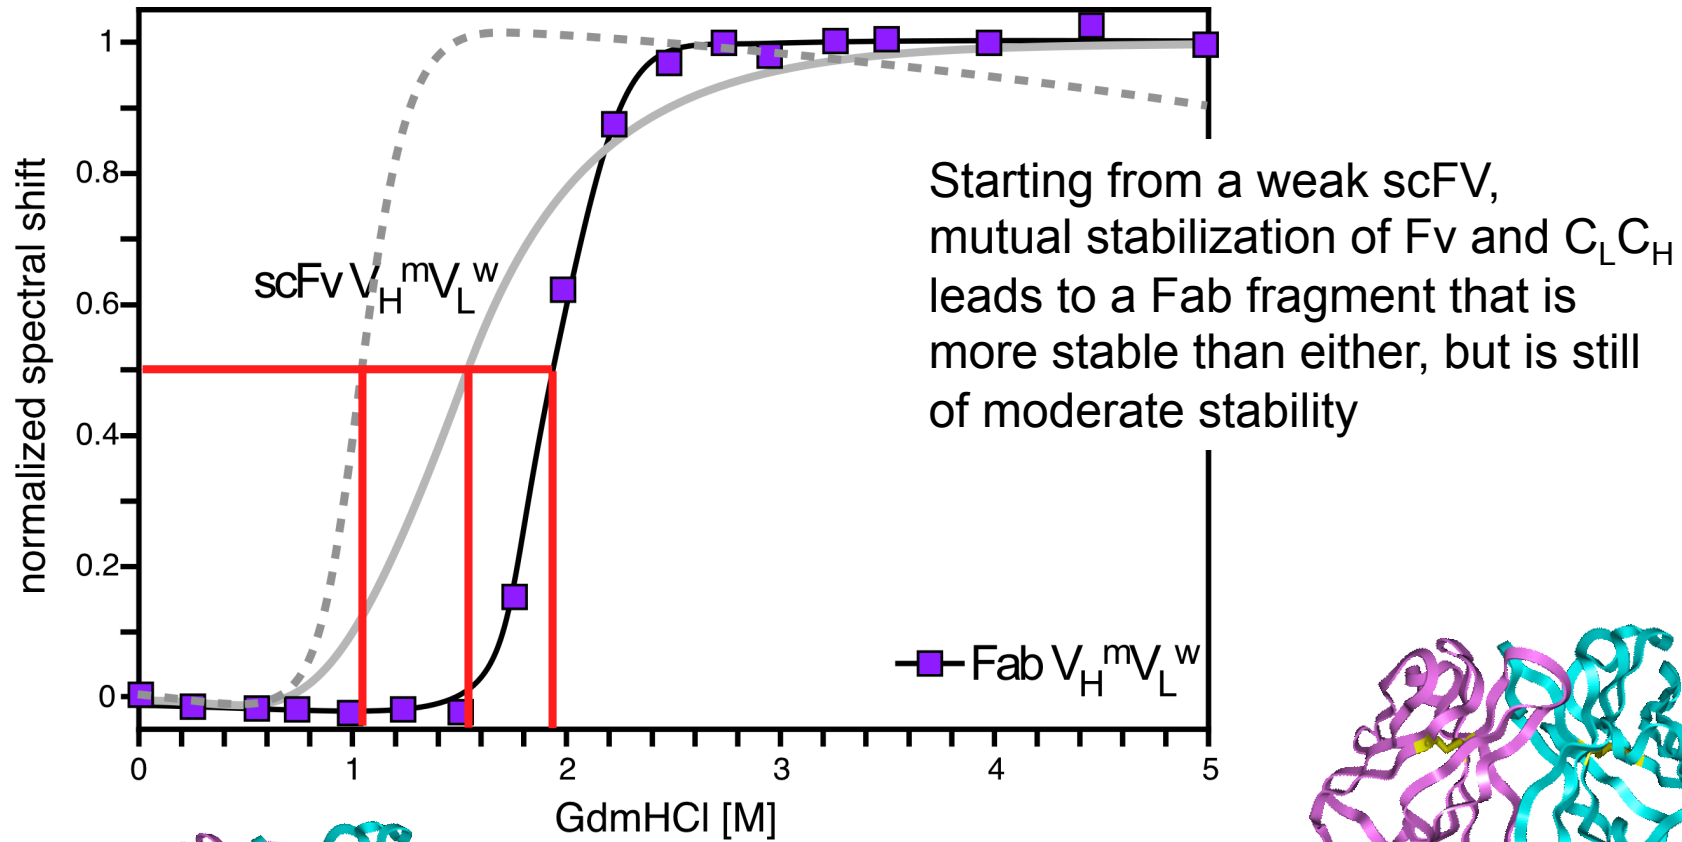

Changes in the fluorescence spectra in multistate unfolding of scFv showed no evidence of the two native domains dissociating.

Loss of the interface between VH and VL was always coupled to the unfolding of the weaker domain

A weak interface can therefore be compensated by stabilizing the weaker of the two domains.

from scFv to Fab

+

Mutual stabilization of V_L and V_H in scFv

For two extremely stable domains, no mutual stabilization is observed. However, we found no evidence of the two domains dissociating without unfolding

Mutual Stabilization of C_L and C_H

The C_L/C_H pair shows poor thermodynamic stability, but has to overcome a high activation barrier to unfold

$C_H C_L^{SS}$
◇ 1 day
◇ 3 days
◇ 14 days

From scFV to non-disulfide linked Fab

The equilibrium stability of a non-disulfide linked Fab is limited by the stability of the C_L/C_H pair

Fab $V_H^S V_L^S$
□ 1 day
□ 3 days
□ 9 days
□ 26 days

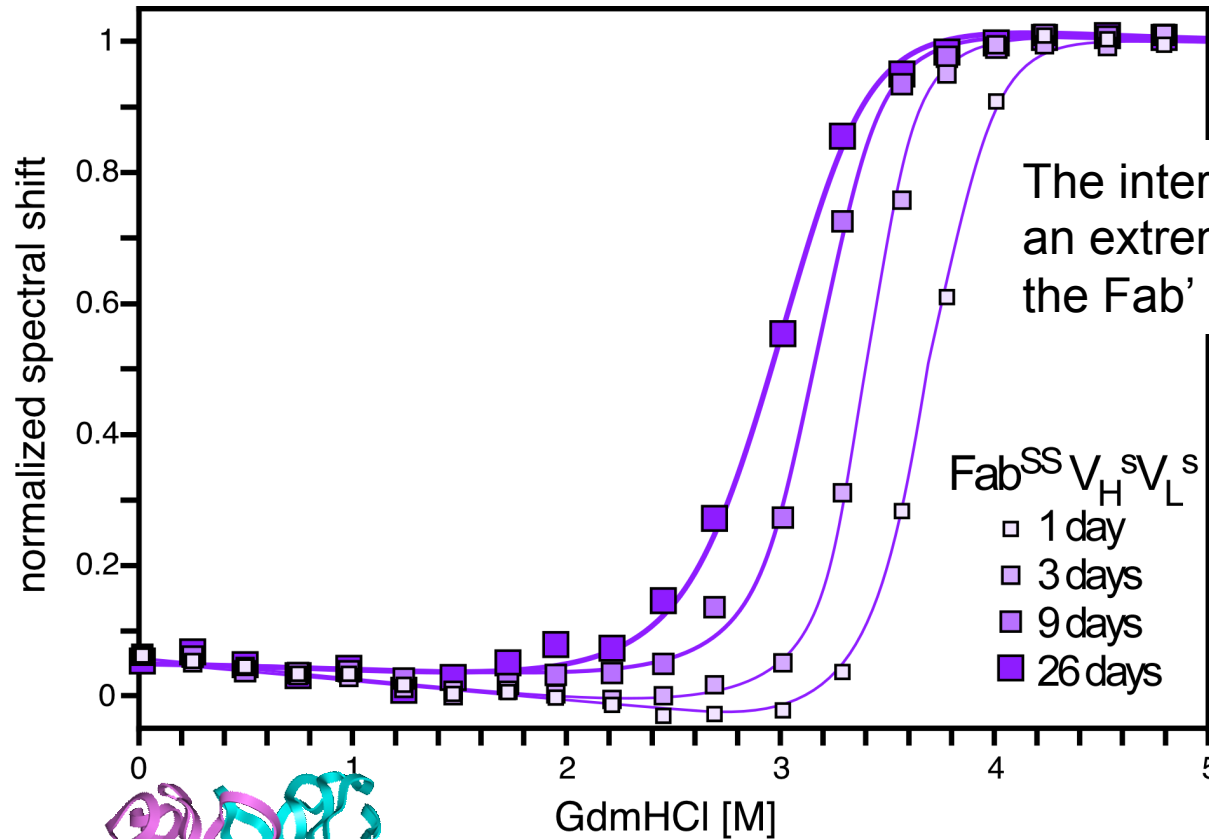

+

Influence of the inter-chain disulfide bond

Summary

- The extent of mutual stabilization of V_L and V_H depends on the individual sequences due to the strong contribution of CDR-3s to the domain interface, and is mainly relevant for weak domains.
- There is no stabilization between V_L and C_L in the isolated light chain, nor between V_H and C_H in the Fd fragment.
- The $C_L C_H$ heterodimer dissociates in the absence of an interdomain disulfide bond.
- $[GdmHCl]_{50}$ of $C_L C_H^{SS}$ equals $[GdmHCl]_{50}$ of the isolated C_L domain.
- Kinetic stabilization of the disulfide linked $C_L C_H^{SS}$ heterodimer.
- Above a $[GdmHCl]_{50}$ of the scFv of 1.5 - 2 M, the stability of the constant domains becomes limiting for the stability of the non-disulfide-linked Fab
- In the disulfide-linked Fab', even strong variable domains profit from the kinetic stabilization of the $C_L C_H^{SS}$ heterodimer, while the $C_L C_H^{SS}$ is significantly stabilized by its interaction with the $V_L V_H$ heterodimer.

**How many mutations are needed
to “repair” the weak human
germline fragments?**

Features that lead to unstable and aggregation-prone antibody domains

Conserved hydrogen bonding interactions

core hydrogen bonding network (Glu/Gln 6, Thr 143, Tyr 104)

Hydrophobic core packing

steric clashes and cavities destabilize the domain,
mutations to hydrophilic residues are destabilizing

Hydropathic contrast between core and surface

hydrophobic surface residue can decrease folding efficiency

Conserved charge interactions

buried charge cluster (Arg 77, Asp 100, Glu 99, Arg/Gln 45, Glu/Arg 53)

Conserved unusual main-chain torsion angles

positions which enforce a positive Φ torsion angle, conserved Gly

Conserved Pro positions

cis-Pro L8 and L136 of V_Lκ, conserved trans-Pro in various positions

Secondary structure propensity and torsional preference

Two different scFv: 2C2 (V_K3-V_H6) and 6B3 ($V_\lambda3-V_H6$):

	yield	stability
Gln H5 Val (secondary structure propensity)	+	+
Ser H16 Gly (pos. Φ , conformational strain)	+	+
Thr H58 Ile (hydrophobic packing, to V_H consensus)	0	+
Ser H76 Gly (pos. Φ , conformational strain)	+	+
Ser H90 Tyr (semiexposed hydrophobic, to V_H cons.)	+	0
Val H72 Asp (exposed hydrophobic residue)	+	0

**[GdmHCl]₅₀ shifted from 2.0 to 2.8 M
and from 0.7 to 2.5 M ***
**Total stabilisation by 21 and 25 kJ/mol
from 51 to 72 kJ/mol
and from 42 to 67 kJ/mol ***
**Total increase in yield 4.3 and 4.2-fold,
from 1.2 mg/L to 5 mg/L
and from 0.4 mg/L to 1.7 mg/L**

Improving the huV_H6 consensus framework

- Six mutations were needed, five of them common to huV_H2, huV_H4 and huV_H6:
- Three mutations improved both stability and yield
- Two improved the folding yield, but had no measurable effect on thermodynamic stability
- One significantly improved stability without affecting the folding yield
