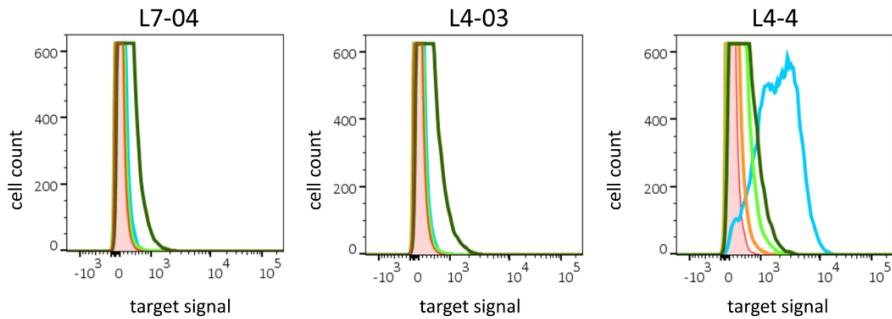

Figures S1 to S2

Tables S1 to S2

**a Multivalent target measurement**

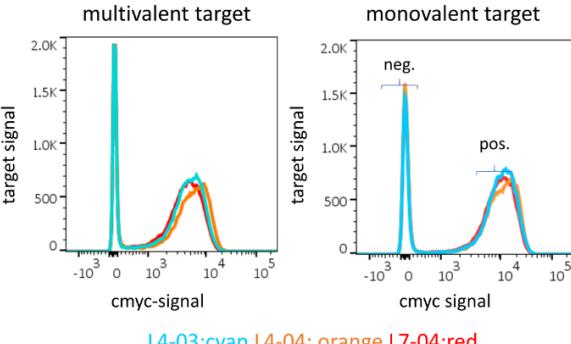

**b Monovalent target measurement**

**c  $K_d$  measurements**

	L7-04	L4-3	L4-4
A-target	2000	2300	89
I-target	40	72	23
R-target	190	230	5
H-target	560	570	13

**d Expression controls**

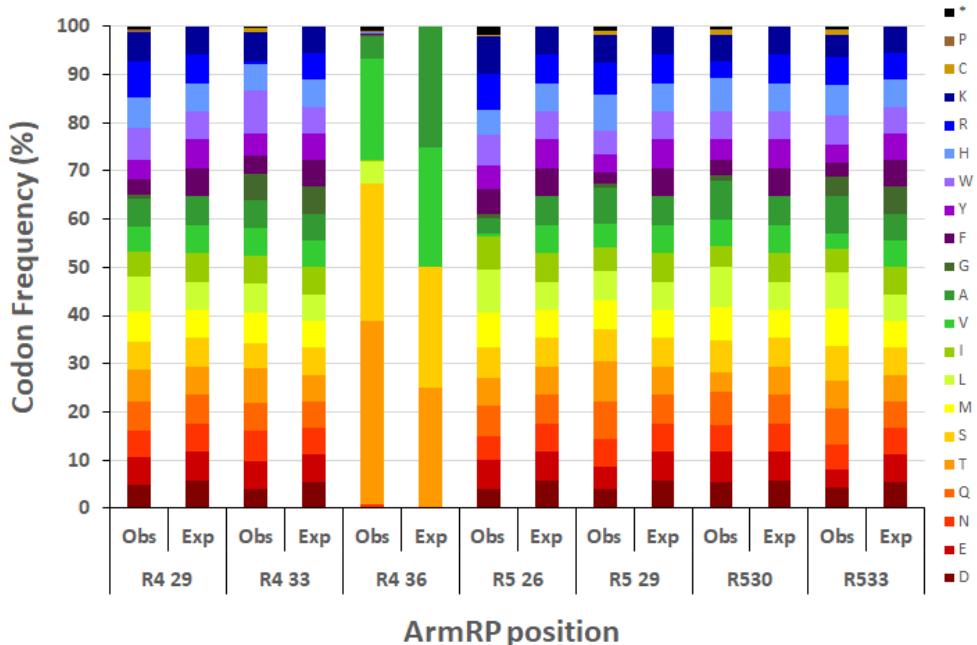

**Fig. S1. Comparison of single-clone yeast analysis for multi- and monovalent targets.** a) Measurement with multivalent target (SA-based). L7-04, L4-3 and L4-4 denote different ArmRPs, the colors denote different targets, as shown in the table with matching colors. When comparing the flow cytometry results with the  $K_d$  data obtained from the purified protein expressed in *E. coli* and measured by fluorescence anisotropy (c), it can be seen that the signal intensity does not correlate to the  $K_d$  data and seems randomly distributed. The highest affinity binders do not show the strongest shifts in flow cytometry. Shown with a red filled curve is the signal generated by SA only. b) Experiments using monovalent target. The signal intensities correlate better with the  $K_d$  data. c) Measured  $K_d$  data for the targets and dArmRP variants are shown. d) Comparison of the expression signal for the individual single clones used for the comparison between multivalent (SA based) and monovalent targets (GFP fusions). For both plots, a negative (non-expressing) and a positive (expression) population is observed. The expression control is performed by detecting the C-terminal c-myc-tag on the displayed ArmRP. The negative population results from freshly divided cells that show no display yet. As shown here, the expression for the investigated clones L4-03 (cyan), L4-04 (orange) and L7-04 (red) can be considered the same and does not explain the inconsistencies observed for the target signal.

## a MAX randomisation strategy and design

## b NGS analysis of codon representation

**Figure S2. MAX randomization of insert for the second yeast display library (Tyr pocket).** a) A region of the dArmRP gene encompassing repeats 3-6 was divided into three sections, comprising a conserved region (grey), repeat 4 (green) and repeat 5-6 (purple). The conserved region was synthesized from two overlapping oligonucleotides with the sequence 5'-AATGAACAAATCTTGCAGAGGGCCTTGCGGCCCTCAGCAATATCGCTTCTGGAGGC-3' and 5'-TGGCAGGGCCCCTCGCTCAATCACAGCCTGGATCTGCTCATCGCTCCAGAAGCGAT-3', which were hybridized, extended and cloned. Having confirmed the correct sequence, the resulting fragment was amplified with primers 5'-AATGAACAAATCTTGCAA-3' and 5'-GGCTGGCAGGGCCCCCTGC-3'. Repeats 4 and 5-6 were created using MAX

randomization (21) with selection, template and end oligonucleotides as indicated by green and purple lines, respectively, where “XXX” indicates MAX codons of sequence Ala=GCT, Asp=GAT, Glu=GAA, Phe=TTT, Gly=GGT, His=CAT, Ile=ATT, Lys=AAG, Leu=TTG, Met=ATG, Asn=AAT, Gln=CAA, Arg=AGA, Ser=TCT, Thr=ACT, Val=GTT, Trp=TGG and Tyr=TAT as required. All selection oligonucleotides and both “End 2” oligonucleotides were obtained pre-phosphorylated. Repeat 4 was then amplified with primers 5'-GCAGGGGCCCTGCCAGCC-3' and 5'-GCCGGCATCAATAACGGC-3', and repeat 5-6 was amplified with primers 5'-GTTATTGATGCCGGCGCC-3' and 5'-ATCGATTACTGCTTGGAT-3'. Thereafter, the three fragments were joined by overlap PCR and the completed randomized section was amplified by primers 5'-AATGAACAAATCTTGCAA-3' and 5'-ATCGATTACTGCTTGGAT-3'. The resulting cassette, randomized at positions R429 (X1), R433 (X2), R436 (X3), R526 (X4), R529 (X5), R530 (X6) and R533 (X7) was assessed by NGS sequencing. b) NGS data of the randomized cassette were analyzed as described (21) and show good agreement between expected (design) and observed (experimental) codon frequencies at each randomized position.

**Table S1. Amino acids sequence of all binders.** Indicated in bold are the residues that deviate from the consensus designed sequence to bind the target amino acid.
